

Qualcomm Moves For Gesture Recognition

Written by Marco Attard
29. July 2011

Qualcomm acquires a number of IP assets and "key engineering resources" from GestureTek, a gesture recognition technology developer.

The purchase is part of Qualcomm's bid for integration of multiple technologies into single-chip solutions-- offerings currently packing Snapdragon processors, Adreno graphics engines, Gobi multi-format radio, Atheros wifi connectivity and GPS.

The company will integrate GestureTek's technology into its current and next-generation Snapdragon processors which will then go into smartphones, tablets and home entertainment devices.

GestureTek will still continue its business, specifically in gesture-controlled public displays and digital signage.
