

Motorola claims its next tablet will be the first running Android 2.4, also known as Honeycomb.

As the next version of Google's OS, Honeycomb is oriented for tablet devices as well as smartphones. Other Android tablets on the market run Android 2.2 or below.

The Motorola Honeycomb tablet is supposed to have an NVidia dual core 3D processor (possibly the company's Tegra 2) and videochat-- at least as confirmed by Google VC Andy Rubin at D:Dive into Mobile.

Other rumours also suggest a 5MP back-facing camera, 7" and 10" versions, a gyroscope and 3 network options (UMTS, CDMA and LTE).

Meanwhile tech blog Engadget reveals a yet unnamed Toshiba Android tablet-- one that's also Tegra 2-powered and is to run on Honeycomb. More news will certainly come out in a few days on these-- and many other-- tablet devices at CES 2011.
