

Plugging Anything into iDevice Docks

Written by Marco Attard

CableJive presents a solution for your non-iDevice using customers living in a world full of accessories with Apple 30-pin dock connectors-- the DockBoss, letting users connect any device with a 3.5mm jack to an iPhone dock.

It is compatible with nearly every audio-output device out there (except VW and Audi stock iPod/iPhone systems) and since it takes power from both USB and Firewire docks it works with old and new accessories.

75cm worth of cable extend dock reach a little bit more, and a red indicator light flashes to show when the device is ready to play audio.
