Customers wanting a more physical representation of their digital lives might find the Nimbus Smart Dashboard worthy of purchase-- a 4-dial dashboard designed to display data from any number of sources via physical speedometer-style needles.

Looking like something out of a muscle car dashboard, the Nimbus connects to the Wink smartphone app and gathers data such as commute times, email volume, social media activity, calendar appointments and FitBit stats.

Once the device is synced (via wifi and rapidly flashing lights) customers can select which stats the 4 gauges will display. Each gauge also features an LED mini-display to show exactly what each needle is monitoring.

In addition the dashboard also doubles as an alarm clock.
