

A Keyboard for all Devices

Written by Marco Attard

Logitech announces the K480 Bluetooth multi-device keyboard at IFA 2014-- a perhaps self-explanatory device the company describes as "the first desk keyboard designed for use with up to three devices."

In other words, customers can use it with up to three Bluetooth-enabled devices (Windows or Mac PCs, iOS or Android smartphones and tables), with an "Easy-Switch" dial allowing for, well, easy switching between whatever it is connected to.

It features a full-size keyboard layout complete with all familiar shortcut keys, and an integrated stand in which one can slot a tablet or smartphone.

"Typing needs have evolved and consumers are computing and texting across multiple screens, often using two or three different operating systems," Logitech adds. "The K480 makes it simple for people to work, create or communicate quickly and comfortably, no matter what computing device or platform they are using."

The K480 keyboard is available now in either black or white.
