

A Doctor for Faster USB Charging

Written by Marco Attard

Hdfury releases what it claims is a means to safely turn any USB port into a fast-charging port-- the USB Doctor, a tiny (weighs all of 7g) device able to speed up device charging times by up to 2 times.

According to the company it not only provides a universal connector for just about any device (including iOS/Android tablets and smartphones, joypads and other gadgets), it also turns regular USB cables into dedicated "charge-only" cables.

It supports PC USB ports, power banks, car chargers and travel chargers, and also prevents the malware and accidental data exchange risks brought about with using charging kiosks.

An LED light shows device charging status-- if the light is on for over 3 seconds charging is underway (output is over 1A), while quick flashing shows charging is nearly complete (output is less than 50mAh).

The USB Doctor is available now.
