

Power sharing Between Devices via Cable

Written by Marco Attard

Samsung announces a means for users to share power between devices-- the Power Sharing Cable, a cable allowing one to transfer power to any micro USB-compatible device from a number of Galaxy devices.

The Galaxy devices include the S 5 and Tab S, among others.

The cable requires installation of a Power Sharing app (from either Google Play or Samsung Apps stores), which allows users to select the amount of power they want to transfer. Following that one simply needs to plug the cable in the devices in question.

The Power Sharing cable is available now in either black or white.
