

Glasgow-based headphone maker RHA announces means to allow customers to use wireless headphones with just about any audio source with a 3.5mm or double 3.5mm jack-- the Wireless Flight Adapter.

While primarily aimed at use with in-flight entertainment systems (thus the name), the Wireless Flight Adapter is ideal to connect wireless headphones with devices such as the Nintendo Switch or a vintage piece of audio hardware. The pocket-size device promises up to continuous 16 hours of use on a single charge, and can stream audio simultaneously to two pairs of headphones.

Further features include Bluetooth 5.0 support with aptX and aptX Low Latency, wireless range of up to 10m and modular 3.5mm connectors customers can simply retract in the casing when not in use. Charging takes place over USB-C, and the package includes a 20cm cable.

The Wireless Flight Adapter is available now.
